

How to setup this project

If you are using **Windows** then install the following Softwares:

- XAMPP can install by following [this](#) guide.
- Eclipse can be installed from [here](#)

And if you are using **MacOS** then install the following softwares:

- MAMP can be installed by following [this](#) guide
- Eclipse can be installed from [here](#)

After the successfull installation of softwares, Run the eclipse

Then import the project into eclipse

Click on **File** -> **Open Projects from File System** -> **select project folder where Start.Java is located**

Our sample exported database is located in **database/d-care.sql**

So, import this database file into XAMPP/MAMP

You are just one step behind the installation. Now, you need to set the database configuration (database name/ username/password/) in

model/Database.java

All Set. Just run the Start.java file and you should be able to see the Main Screen.
